

AMC Filtration for Commercial Spaces

Airborne molecular contamination (AMC) exists in every environment. Rather than physical particles, AMCs are gas molecules that are part of and move with air.

The Entegris approach is **See it, Control it.** “Seeing” means measuring the contamination first in order to characterize the environment, and “controlling” means implementing a filter solution that is tailored to that specific environment. Adsorbents should be adjusted to match the measured challenge of each use case.
